- a rotary member, having a substantially hollow tubular shape;

- a base, integrally fixed within the rotary member;

- a fixing holder, provided with a through hole along a center axis direction thereof;

- a driving cam portion, including:

 - a rotary cam member, which is engaged with the rotary member and which is slidable only along a shaft direction;

 - a fixing cam member, which is integrally fixed to the fixing holder and is arranged opposite to the rotary member; and

 - a first compression spring, which is elastically provided between the rotary cam member and the base;

- a holding cam portion, including:

 - a lift cam member, which is coupled to the fixing holder;

 - a slide cam member, which is engaged with the base, which is slidable only along the shaft direction, and is arranged opposite to the lift cam member; and

 - a second compression spring, which is elastically provided between the slide cam member and the base, the elastic force of the second compression spring is smaller than that of the first compression spring; and

- a clutch portion, including:

a ball, which is slidably held by the fixing holder along a radial direction on a plane perpendicular to an axis and which engages the rotary cam member at a slidable end thereof; and

a cam shaft, which is slidably held only along the shaft direction by the fixing holder, which has a cam groove engaged with the ball, and which is slid with the slide cam member in an integral manner along the shaft direction, as substantially described and connected with the other limitations recited in the claims.
